

Avoid costly downtime with an advanced approach to procurement

When critical assets require repairs or routine maintenance, delays caused by out-of-stock parts or an inefficient purchase order process can lead to extended equipment downtime and slow maintenance operations. These challenges become even more complex when managing multiple systems with limited inventory visibility across locations. By unifying parts ordering and inventory management, maintenance teams can work more efficiently, reduce costs, and improve overall operations.

The solution

Advanced Procurement in Asset Essentials provides a seamless, end-to-end approach to managing parts inventory and optimizing the purchase order process. By consolidating procurement and maintenance workflows into a single system, teams can automate approvals, enhance inventory visibility, and ensure critical parts are available when needed.

Better visibility

- Instantly identify parts that need to be reordered
- Easily trace approvals and see delivery status from a single system

Increased process efficiency

- Simplify the PO generation process and enable easy modification
- Reduce order processing time with automated approval workflows and notifications based on pre-set thresholds

Improved accuracy

- Match preferred suppliers to specific locations to ensure optimal delivery times
- Create an audit trail for compliance by preserving PO details and activities
- Validate received parts to invoices to confirm cost and quantity are accurate

What users say

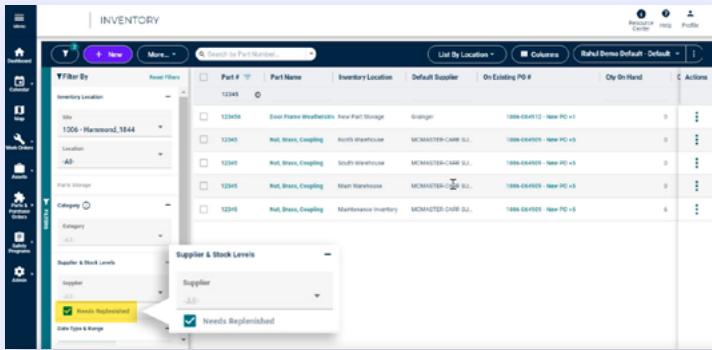

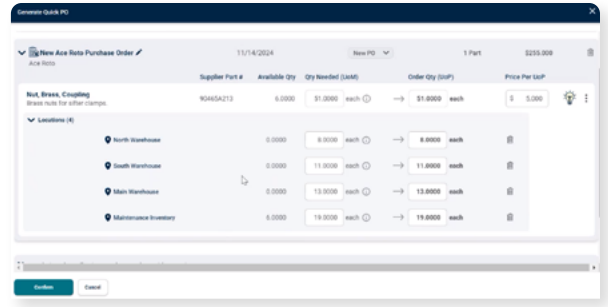

Asset Essentials is incredibly customizable, which might be intimidating to some people, but it allows you to get visibility you wouldn't have otherwise. You can make it as useful as you can imagine.

Get intelligent recommendations with smart POs

With Smart PO in Asset Essentials, you can reduce out-of-stocks or inventory imbalances by facility with system recommended optimal order quantities and preferred supplier based on location. Your suppliers and procurement teams will benefit when the system recognizes opportunities to consolidate orders by automatically adding parts to a purchase order based on supplier and PO status.

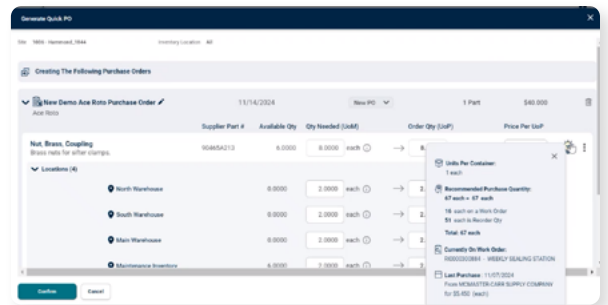

Enhance low-stock visibility

With Asset Essentials, decision makers can now quickly and easily identify parts that need to be reordered based on preset parameters. This reduces the risk of missing a low availability level or exhausting the inventory of a critical part. It also allows you to reduce costs by eliminating the expense of urgent orders and overnight delivery expenses while ensuring parts are distributed to the right locations.

Make operations run more smoothly

With tools to configure workflows, set default suppliers, and track availability status, reliance on manual processes and incomplete cross-department communication is reduced. Maintenance teams can maintain control over the parts inventory and ensure that approvals are obtained in a timely manner, PO's are optimized to efficiency and supplier, and that high costs and unnecessary downtime don't negatively impact the bottom line.
